My Comment :

\*\*\*\*\*

Clinical information : headache and dizziness

Pulse sequence; Axial T1WI, sagittal T1WI, axial T2WI, axial FLAIR, axial subseptibility weighted image, axial DWI, Intracranial TOF MRA, T13D

Finding : \*\* Brain MRI and MRA

- Multifocal hyperintense foci at bilateral subcortical and deep white matter.
- No evidence of abnormal signal intensity in cerebral hemisphere and posterior fossa
- No definite abnormal signal intensity on mid brain and brain stem
- No evidence of acute infarction, hemorrhage or mass effect
- No hydrocephalus or extra-axial collection of CSF
- Atherosclerotic change and mild narrowing at both distal ICAs.
- Focal vacular protruding at left paraclinoid ICA

===== [Conclusion] =====

- Old lacunar infarction, at left basal ganglia
- Dense calcification, left thalamus
- Degenerative white matter change, Fazekas grade 1
- Atherosclerotic change and mild stenosis at both distal ICAs.
- Suggestive of small aneurysm, 2 mm, left paraclinoid ICA  
; no interval change, compared with previous study
- Infundibular dilatation, left P-com
